

♥ Your Heart: 4 Rooms Working as a Team! ♥

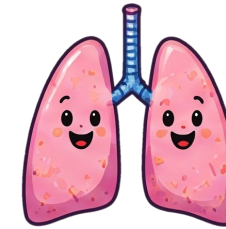

Fun fact!

Your heart is about the size of your fist but is one of the strongest muscles in your body!

The heart sends blood **with oxygen** and nutrients out through the aorta to every part of your body.

The ECG: Your Heart's Electrical Map!

Your heart has a tiny electrical system that tells each room when to squeeze. An ECG is a machine that reads those signals.

The body's cells use oxygen and send blood back **without oxygen** to the heart.

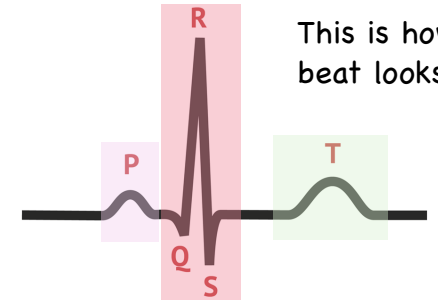

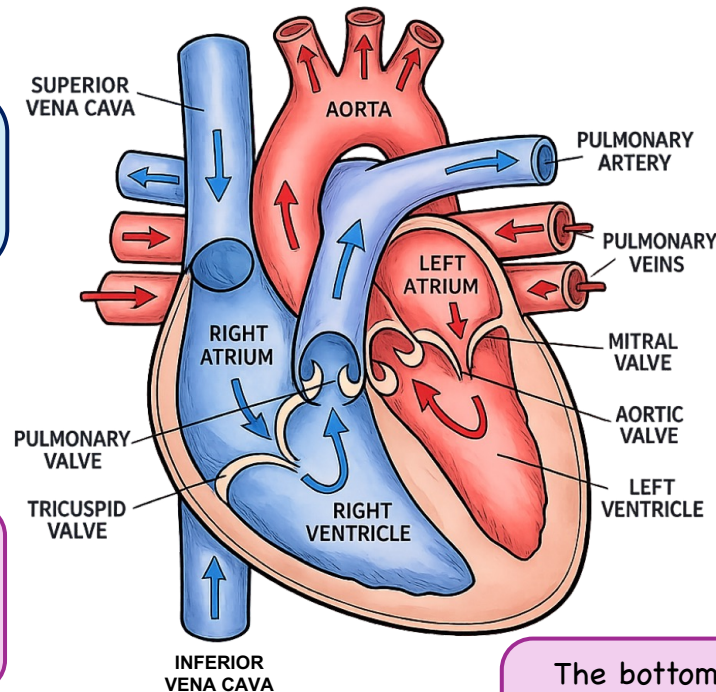

At the Lungs, blood drops off carbon dioxide and picks up oxygen.

The valves are like doors that open one way, so blood keeps moving forward!

The top 2 rooms are the **ATRIA**. Blood comes in and waits before going to the next room (like waiting rooms).

The bottom 2 rooms are the **VENTRICLES**. They push the blood out to the lungs or to the rest of the body.

This is how one beat looks!

P

Small bump (P wave)

The atria squeeze to send blood to the ventricles.

QRS

Big spike (QRS complex)

The ventricles squeeze hard to send blood to the body and lungs.

T

Big bump (T wave)

The heart relaxes and reset to get ready again!

The heart works non-stop, beats about 60-100 times every minute. Even when you are resting!
